

The Monodraught SunPipe is a natural lighting system that eliminates the need to use electric lighting during daylight hours.

When mounted on the roof of a building the highly reflective SunPipe tube reflects and intensifies sunlight and normal daylight into the space below, and spreads light evenly using a patented prismatic diffuser; lighting rooms without glare and eliminating heat transfer.

We are using a diamond shaped dome which ensure that dust and dirt is washed off naturally and therefore no maintenance is required outside or inside the building.

If required the SunPipes can be mounted horizontally to pipe light deep into interiors, which can be used in basements as well.

At least 75% of electricity costs used for lighting can be saved during daytime, where SunPipes are used to replace electric lighting during daylight hours.
